#### **Description**

The model 734P is a miniature piezoelectric accelerometer designed specifically for tri-axial vibration measuring at high temperature environment. Miniature size for compact structures and light weight test purpose. The unit is hermetically sealed and ideal for use in extreme environments. This sensor is the industry standard for vibration/shock accelerometers. The model 734P features a central hole configuration for high frequency mounting. The accelerometer is a self-generating device that requires no external power source for operation. Model 734P operating in annular shear mode. These specially designed crystals exhibit low base strain sensitivity, high resonance frequency, and excellent output stability over time. Signal ground is connected to the outer case of the unit. The accelerometer features three M3 side connector and requires a low-noise coaxial cable for error-free operation. Senther's model 12P-3 is a M3 to BNC breakout low noise cable for the sensor.
